# HASH-BASED DISK INDEXING (BASED ON THE COW BOOK: 11.1 AND 11.2)

#### Introduction

- Hash-based indexes are best for equality selections.
  Cannot support range searches.
  - Static hashing
  - Extendible hashing (dynamic)
  - Linear hashing (dynamic) not covered in the course, see
    11.3 in the cow book

### **Static Hashing**

- # primary bucket pages fixed, allocated sequentially, never de-allocated; overflow pages if needed.
- h(k) mod M = bucket to which data entry with key k belongs.
  (M = # of buckets)

# Static Hashing (Contd.)

- Buckets contain data entries.
- Hash function works on search key field of record r.
  Must distribute values over range 0 ... M-1.
  - What is a good hash function?
  - h(key) = (a \* key + b) usually works well.
  - a and b are constants; lots known about how to tune h.
- Long overflow chains can develop and degrade performance.
  - Reorganization is expensive and may block queries
  - Extendible and Linear Hashing: Dynamic techniques to fix this problem.

# **Extendible Hashing**

- Why not re-organize file by doubling the number of buckets?
  - Note that reading and writing all pages is expensive!

#### • <u>Idea</u>:

- Use directory of pointers to buckets
- On overflow, double the directory (not the # of buckets)
- Why does this help?
  - Directory is much smaller than the entire index file
  - Only one page of data entries is split.
  - No overflow page! (caveat: duplicates w.r.t. the hash function)
- Trick lies in how the hash function is adjusted!

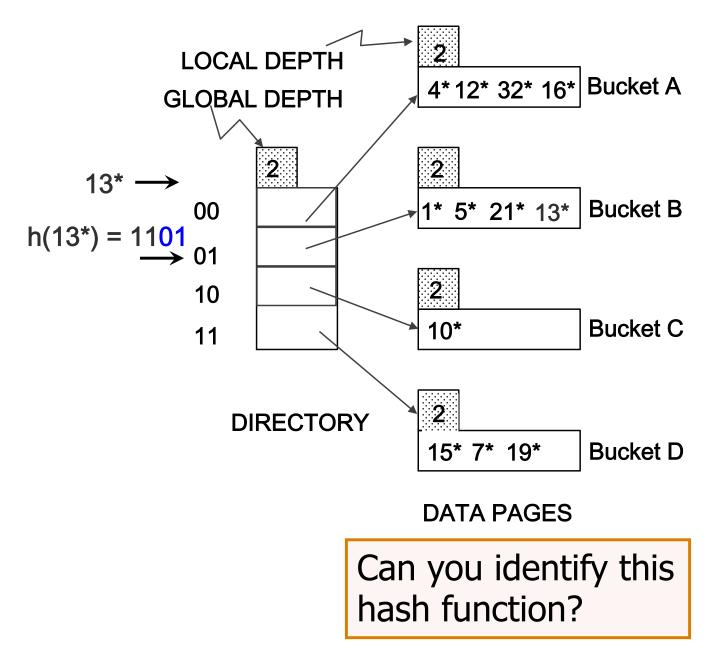

# Example

- Directory an array
- Search for k:
  - Apply hash function h(k)
  - Take last global depth# bits of h(k)
- Insert:
  - If the bucket has space, insert, done
  - If the bucket if full, split it, re-distribute
  - If necessary, double the directory

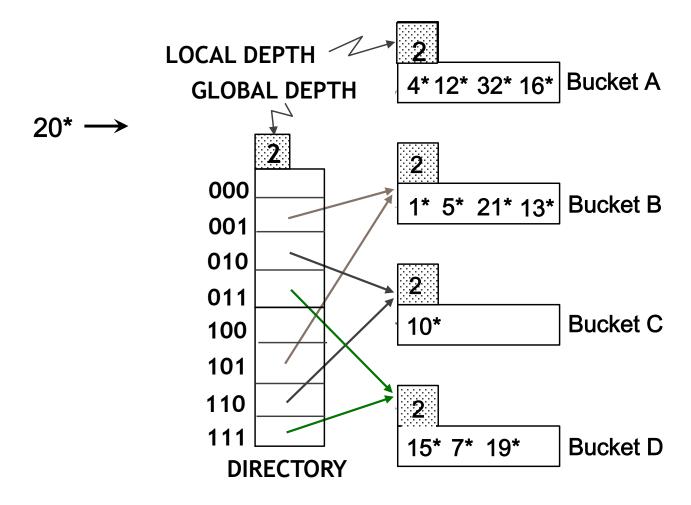

**DATA PAGES** 

Can you identify this hash function?

### **Example**

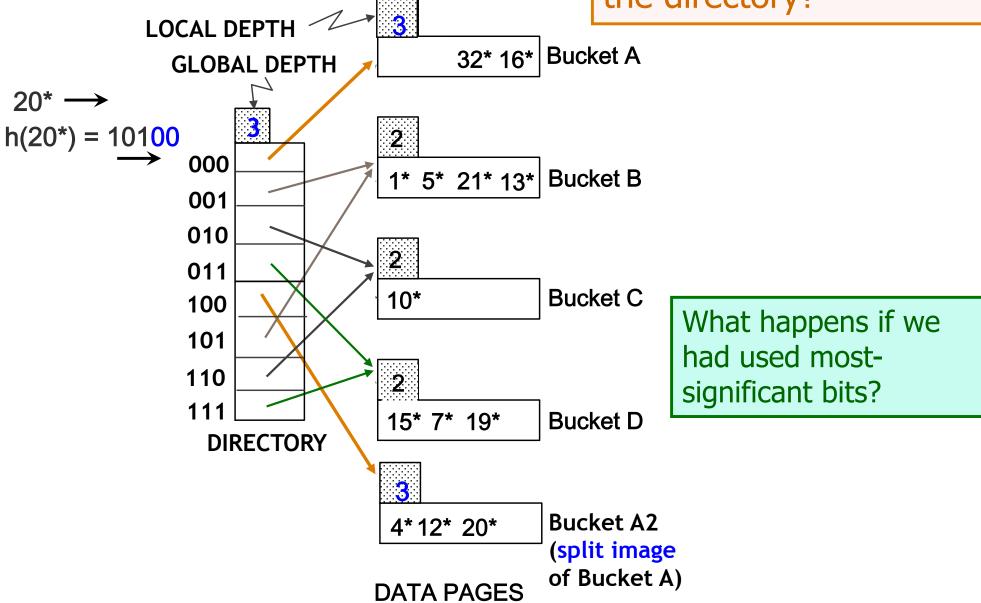

#### Insert 20

#### **DATA PAGES**

#### **Insert 20**

Does splitting a bucket always require doubling the directory?

#### **Comments on Extendible Hashing**

- How many disk accesses for equality search?
  - One if directory fits in memory, else two.
- Directory grows in spurts, and, if the distribution of hash values is skewed, directory can grow large.
- Do we ever need overflow pages?
  - Multiple entries with same hash value cause problems!
- Delete: Reverse of inserts
  - Can merge with split image.
  - Can shrink the directory by half. When?
    - Each directory element points to same bucket as its split image
  - Is shrinking/merging a good idea?
